

PEAK FETTLE

# The private, honest, offline-complete strength system.

Full feature deep-dive and head-to-head competitive analysis against Strong, Hevy, Fitbod, JEFIT, Alpha Progression, Juggernaut AI, RP Hypertrophy and Boostcamp — grounded in the shipped codebase and July 2026 review research.

# Five moats no competitor can copy

**Architectural privacy** — Free-tier data physically never leaves the phone — on-device SQLite, zero personal REST calls, E2E-encrypted backup (AES-256-GCM). Rivals require accounts + cloud; JEFIT was breached (9M accounts), Gymverse discloses health data as tracking data.

**Honest, deterministic programming** — A reproducible Training Engine that shows its work ("Why this plan" rule traces) — in a market where reviewers call out Juggernaut, RP and JEFIT for rules dressed up as "AI."

**Rankings built into the logging loop** — On-device strength percentiles + tier ladder — lognormal, DOTS-calibrated, age/training-age adjusted, free. Rivals offer none in-app; web calculators need cloud and manual entry.

**A free tier that embarrasses the category** — Unlimited routines and history, supersets/dropsets/circuits, plan generation, rankings, calculators, importers, export — no ads. Strong caps at 3 routines; Hevy at 4 with ads; Fitbod has no free tier at all.

**LifeOS: a category with no incumbent** — The only product pairing a serious strength tracker with workout-gated screen time. Existing gates stop at step counts and camera push-ups.

*Positioning: pro-grade programming and rankings with zero cloud dependency — plus the only screen-time gate that demands a real workout.*

# Each corner of the market has a documented complaint

## Fast loggers

Strong · Hevy

"Feels stagnant... hasn't evolved in years." Strong's watch app "crashes multiple times every workout." Hevy free: 4 routines, 7 custom exercises, ~3-month history, ads.

## "AI" coaches

Fitbod · Juggernaut · RP

Fitbod at \$15.99/mo called "generic and repetitive." Juggernaut's AI "is an expert system." RP sits at 2.8/5 on Trustpilot; price is the #1 complaint.

## Program libraries

Boostcamp · JEFIT

Boostcamp: "crashes, slow loading, issues with workout history" + paywall creep. JEFIT: 9M-account breach; 2026 redesign made navigation "drawn out and clunky."

## Screen-time gates

ClearSpace · Steppin · Lock In

Gates top out at steps and camera-counted push-ups. The one tracker+gate combo attempt ("Lock In") is shallow on the training side. No incumbent owns both halves.

# The logging core: deeper than Strong, faster than JEFIT

## Stepper logger

Weight in exact kg under the hood; lb/kg display via one conversion layer. Per-set notes and flags, RIR ⇌ RPE display toggle.

## Structures, all free

Supersets, dropsets, circuits of 3–5 exercises with rotation editor, EMOM / AMRAP / interval timers, group rest modes.

## Substitutes & alternatives

Preload an alternative per exercise ("machine is busy") — one-tap swap mid-session, per-routine or global scope. No rival has this.

## Calculators that respect machines

Plate math including 2:1 / 1:2 pulley-ratio effective load, warm-up ramps, 1RM. Strong paywalls a barbell-only version.

## Rest timer, everywhere

Live Activity + Dynamic Island countdown, lock-screen visible. Backdate past workouts; edit any historical set.

## 220-exercise catalog

Every exercise ships muscle diagrams + form cues (100% media coverage), searchable library, custom exercises unlimited.

*Solves the documented speed-vs-depth trade-off: Strong is fast but shallow, JEFIT is deep but "clunky" — Peak Fettle is both.*

# No "AI" theater: rules you can read

1

**Survey → plan** — Goals, schedule, equipment and constraints generate a periodized plan — deterministic and reproducible (seeded PRNG). Free tier included.

2

**"Why this plan"** — Every prescription carries a rule trace — the evidence-based reason, in plain language, for each set, rep range and progression call.

3

**In-session autoregulation** — Deterministic load/effort suggestions react to your logged performance as you train — no black box, thresholds documented.

4

**Fatigue-aware adjustment** — Readiness + volume signals trigger deload-forward or accessory-trim advice, with 3→28-day dismissal backoff. One tap applies it.

## What reviewers say about the "AI" rivals

### Juggernaut AI (\$349.99/yr)

*"The AI... is an expert system" — a decision tree. Volume "from too little to way too much."*

### Fitbod (\$95.99/yr)

*"Generic and repetitive workouts that fail to meet user expectations."*

### RP Hypertrophy (to \$299.99/yr)

*Trustpilot 2.8/5. "Price is the big one," steep setup, no offline use.*

# Motivation without a feed: rankings, streaks, groups

"Am I strong?"

answered on-device

# Top 18%

Percentile per lift — lognormal-fit, DOTS-calibrated, adjusted for age and training age. Computed entirely offline, free for everyone, feeding a visible tier ladder.

*Rivals: zero in-app percentiles. Web calculators (Strength Level, Gravitus standards) require manual entry or cloud logging.*

**Streaks that forgive** — Streak engine with encouraging reset copy — "every workout is day one of something" — not guilt mechanics.

**23 badges → cosmetics** — Achievements unlock themes and cosmetics instead of clutter. Earned identity, not notification spam.

**Groups of 2–12** — Accountability circles with weekly signals and opt-in, group-scoped leaderboards — the only network call allowed on the free tier, and it's one boolean-grade signal.

**Share cards + routine links** — On-device-rendered PR, tier and weekly-summary cards; routine share links with previews and deep-link import. Virality with zero server dependency.

*Deliberate anti-feature: no public social feed. r/weightroom-style lifters document feeds as unwanted bloat — Hevy's "busy" UI is the cautionary tale.*

# Privacy is the architecture, not a policy paragraph

## Free tier = the phone, period

- On-device SQLite; the free path makes zero personal REST calls (enforced as a code-review invariant).
- E2E-encrypted backup: AES-256-GCM blob, human-readable recovery code. We cannot read it.
- JSON + CSV export free forever. Progress photos never leave the device.
- No ad SDKs. No analytics resale. No account required to train.

*Proof point: the July 14, 2026 API outage. Free users never noticed — the app has no server to lose.*

## The category's privacy rap sheet

**JEFIT** — Aug 2020 breach: 9M+ emails, IPs, usernames, passwords (HaveIBeenPwned).

**Gymverse** — App Store label discloses Health & Fitness data used for cross-app tracking; Mixpanel / AdMob / Facebook Ads SDKs.

**Hevy** — 11 third-party SDKs, 4 of them advertising; ad-supported free tier.

**Fitbod** — Usage data shared with "Advertising Partners" per its own disclosure.

**MyFitnessPal** — 2018 breach (150M) still cited in every Reddit thread — the category's lasting scar.

*"Your training history is yours. We can't read it, sell it, or lose it" — a claim only an architecture can make.*

# Deep in Apple's ecosystem, open both ways

## Ecosystem

**Apple Watch companion** — SwiftUI watch app (live workout mirror shipping; wrist set-logging and HR stages next).

**Live Activities** — Rest timer on the Dynamic Island and lock screen.

**Widgets + Siri** — Home-screen widgets and App Intents voice logging.

**HealthKit** — Workouts and bodyweight sync both ways.

**Localization rail** — 2,322 externalized strings across 9 namespaces — translation-ready.

## Data freedom & velocity

**Switcher importers** — One-tap Strong and Hevy CSV import with exercise mapping, RPE→RIR conversion and dedupe. Their lock-in is our funnel.

**Exit ramp included** — Full JSON/CSV export, free, forever — the #1 Reddit demand ("your data outlives the app").

**OTA ship cadence** — JS-level fixes reach installed apps in hours via EAS Update — no store review wait.

**11 adaptive programs** — Classic templates expressed as engine presets — they adapt and explain themselves; Boostcamp's 11K programs are static PDFs-in-an-app.

*Honest gap: iOS-first today. Android is roadmapped after the iOS wedge is proven — the one checkbox rivals still win.*

# LifeOS: TikTok stays locked until you've trained

## How the gate works

- FamilyControls-based app blocking with escalating unlock friction — not a bypassable reminder.
- The unlock condition is a real, loaded, progressing workout verified by the tracker — not steps, not camera push-ups.
- Cross-app streak where only a per-day boolean ever reaches a server: the gate inherits the privacy story.
- Pro-gated: LifeOS anchors the subscription, so the tracker never needs per-feature paywalls (the Alpha Progression resentment trap).

*Strongest earned-media hook in the roadmap — no tracker feature gets this headline.*

## The "competition"

### ClearSpace (YC)

Camera-ML push-ups / steps / breathing. ~850 ratings.

### Steppin

100 steps = 1 min of screen time. Reliability regressions reported.

### StepLock & clones

Steps or camera reps. Fragmented sub-genre.

### Lock In

The only tracker+gate attempt — training side has no periodization or progression depth.

# Strong & Hevy: beloved, and beatable on the record

## Strong

\$4.99/mo · \$29.99/yr · \$99.99 lifetime

Reviewers' consensus: best-in-class logging UI, deep analytics, fair lifetime price.

"Feels stagnant... hasn't evolved much in years" — v6.2 (Mar 2026) reads as maintenance mode.

Watch app "basically not functioning... crashes multiple times every workout, almost every set."

Free tier: 3-routine cap, no charts, no plate calculator. No programming intelligence at any price.

## Hevy

\$2.99/mo · \$23.99/yr · \$74.99 lifetime · 10M+ users

4.7★ on Google Play; fast bug-fix cadence; the cheapest Pro in the category.

Free tier is a demo: 4 routines, 7 custom exercises, ~3-month history — with ads.

11 third-party SDKs, 4 advertising — the growth engine is your data and a social feed.

No programming: "if you want adaptive guidance and progress feedback, you'll need another app."

*Both have a decade of user data locked in — which is exactly what the one-tap importers convert into Peak Fettle's acquisition channel.*

# The premium tier charges coach prices for rules engines

## Fitbod

\$15.99/mo · \$95.99/yr (hiked Jun 2026)

No free tier — a 3-workout trial that expires before the personalization matures. Long-termers love it; the record says "generic and repetitive" early, subscription-management complaints on Trustpilot.

## Juggernaut AI

\$34.99/mo · \$349.99/yr

Openly described as an expert system, not ML. Powerlifting-only; volume "from too little to way too much"; 1.5–2.5-hour sessions; no rest timer or plate calculator.

## RP Hypertrophy

\$34.99/mo · up to \$299.99/yr

Trustpilot 2.8/5; price is the #1 complaint, steep learning curve, effectively a web wrapper — no offline use at all.

## JEFIT

\$12.99/mo · \$69.99/yr

1,400+ exercise DB and a real free tier — but the 2026 redesign made navigation "drawn out and clunky," and the 2020 breach (9M accounts) never left its reputation.

## Boostcamp

Pro \$14.99/mo · \$59.99/yr

~11K curated programs, none adaptive. Recent updates: "app crashes, slow loading times, issues with workout history" + paywall creep complaints.

Peak Fettle ships adaptive, explained programming in the free tier — the entire premium category’s core product, at \$0, offline.

# Feature-by-feature: nobody else covers the board

🕒 = partial or paywalled. Android: honest gap — roadmapped after the iOS wedge; every other differentiator above is shipping today.

# What rivals charge for less than our free tier

\$0

Peak Fettle free tier: unlimited logging, adaptive programming, rankings, circuits, calculators, importers, export, E2E backup — no ads, ever.

Pro adds LifeOS gating + cross-device sync — one anchor value, not a nickel-and-dime paywall.

Prices verified July 2026 (Fitbod hiked from \$79.99 in June; RP full price; Juggernaut has no free tier).

# Every recurring complaint, answered by design

## Subscription fatigue

*"Features that were free keep moving behind subscriptions" — the most consistent Reddit complaint.*

Free tier is contractual by architecture: logging depth, programming and rankings can't be clawed back behind a server they never touch.

## Privacy distrust

*JEFIT 9M breach, MFP 150M breach, Gymverse tracking labels — breaches earn "lasting negative sentiment."*

Nothing to breach: free-tier data never reaches a server; backups are E2E-encrypted with a user-held recovery code.

## Data lock-in

*"CSV export so you can keep your data long-term" is consistently demanded by lifters.*

Free JSON/CSV export — and free importers from Strong & Hevy, so switching in is one tap too.

## Fake AI

*Reviewers now call out Juggernaut, RP and JEFIT for "AI" that is a decision tree.*

No AI claimed. A deterministic engine that prints its reasoning beats a black box that gets caught.

## Crippled free tiers

*Strong: 3 routines. Hevy: 4 + ads + 3-month history. Fitbod: none.*

Unlimited everything that matters, ad-free — the free tier IS the product; Pro sells LifeOS, not ransom.

# Best in the industry — not by taste, by structure.

- ✓ **Only app where private-by-architecture is true** — Everyone else asks for trust; Peak Fettle removes the need for it.
- ✓ **Only app with free adaptive programming that explains itself** — The \$96–\$350/yr tier's product, at \$0, with receipts.
- ✓ **Only app answering "am I strong?" inside the logging loop** — Offline percentiles + tier ladder — shareable, portable, free.
- ✓ **Only app that will gate your phone on a real workout** — LifeOS creates the category the gating apps can't reach.
- ✓ **Fastest path off every rival** — Their exports are our importers; their paywalls are our landing page.

*The competition is a decade of good loggers, expensive rules engines, and static libraries. Peak Fettle is the first complete system — and the moats are structural.*

# Sources & evidence base

## Peak Fettle (verified in codebase, 2026-07-21)

- Repo feature inventory: tierPolicy.ts (local-first invariant), blobCrypto.ts (AES-256-GCM backup), strengthModelV3.ts (percentiles), plateMath.ts, trainingEngine v2 (autoregulation.ts, fatigue.ts), substitutes.ts, targets/watch + widget + live-activity, i18n rail (2,322 keys), Strong/Heavy importers, 220-exercise media coverage.
- COMPETITIVE\_ANALYSIS\_2026-07-03.md (repo) — pricing/sentiment research with per-claim sources.
- Outage postmortem 2026-07-14 (Railway edge outage; free tier unaffected).

## Competitor reviews & pricing (July 2026 web research)

- Strong: hotelgyms.com, prpath.app, setgraph.app, justuseapp.com reviews (stagnation; watch-app crash reports; free-tier caps).
- Heavy: hotelgyms.com, prpath.app, push-pull.app, trysoma.app (limits, ads, 4.7★ Play rating); blankspaces.app SDK audit.
- Fitbod: sensai.fit (\$15.99 hike, 7.5/10), dr-muscle.com, fitnessstoolsreviewed.com, indiehackers.com ("generic/repetitive").
- JEFIT: haveibeenpwned.com (breach), etechshout.com, G2 reviews (2026 redesign complaints).
- Juggernaut: powerliftingtechnique.com, dr-muscle.com ("expert system", volume). RP: trustpilot.com (2.8/5), dr-muscle.com.
- Alpha Progression: fitnessdrum.com, justuseapp.com. Boostcamp: MWM/app-store review aggregation (crashes, history bugs).
- Strength standards landscape: gravitus.com, strengthlevel via arvo.guru, liftvault.com (percentiles exist only as web calculators / separate apps).
- Reddit sentiment: setgraph.app + corahealth.app 2026 thread roundups (subscription fatigue, privacy, export demands).
